

Electronic Attack on Computer Interfaces

Tomáš Rosa

Cryptology and Biometrics Competence Centre of Raiffeisen Bank International

Department of Algebra, Faculty of Mathematics and Physics, Charles University in Prague

HW versus SW Security Disparity

- When it comes to an assessment of physical or hardware-based attack vectors, there is often a lack of experience to perform a risk analysis meaningfully – *hence, it is usually not performed at all*
 - 802.1X with or without integrity protection on L2?
 - DMA attacks – „This is a problem of unattended computers only, isn't it?“
 - USB 2.0 – a bit dated and will hardly improve anymore, *but its exploitations are recent and getting better each day*
 - PCIe through thunderbolt – DMA attacks and SSD hot plug is just the beginning
 - USB-C – confusing even for its developers; USB 4.0 meant to clean up, but it actually brings further complications
 - Digital video signals – „They are too complex to be attacked, right?“

Ongoing Evaluation – Popular Red Team Toolbox Gadgets

The screenshot shows the Hak5 website's navigation menu. The menu is organized into five columns:

- PRODUCTS** (with a dropdown arrow):
 - WiFi Pentesting
 - WiFi Pineapple Mark VII
 - WiFi Pineapple Enterprise
 - REMOTE COMMAND & CONTROL
 - Cloud C²
- SHOWS**
 - HOTPLUG ATTACKS
 - USB Rubber Ducky
 - Bash Bunny
 - Shark Jack
 - Plunder Bug LAN Tap
 - O.MG Plug
- PAYLOADS**
 - IMPLANTS & REMOTE ACCESS
 - Key Croc
 - Packet Squirrel
 - Screen Crab
 - LAN Turtle
 - O.MG Cable
- COMMUNITY**
 - FIELD KITS
 - Elite Series
 - Essential Series
 - EDUCATIONAL KITS
 - DemonSeed EDU
 - Throwing Star LAN Tap
- SUPPORT**
 - MERCH
 - T-Shirts
 - Accessories
 - Stickers

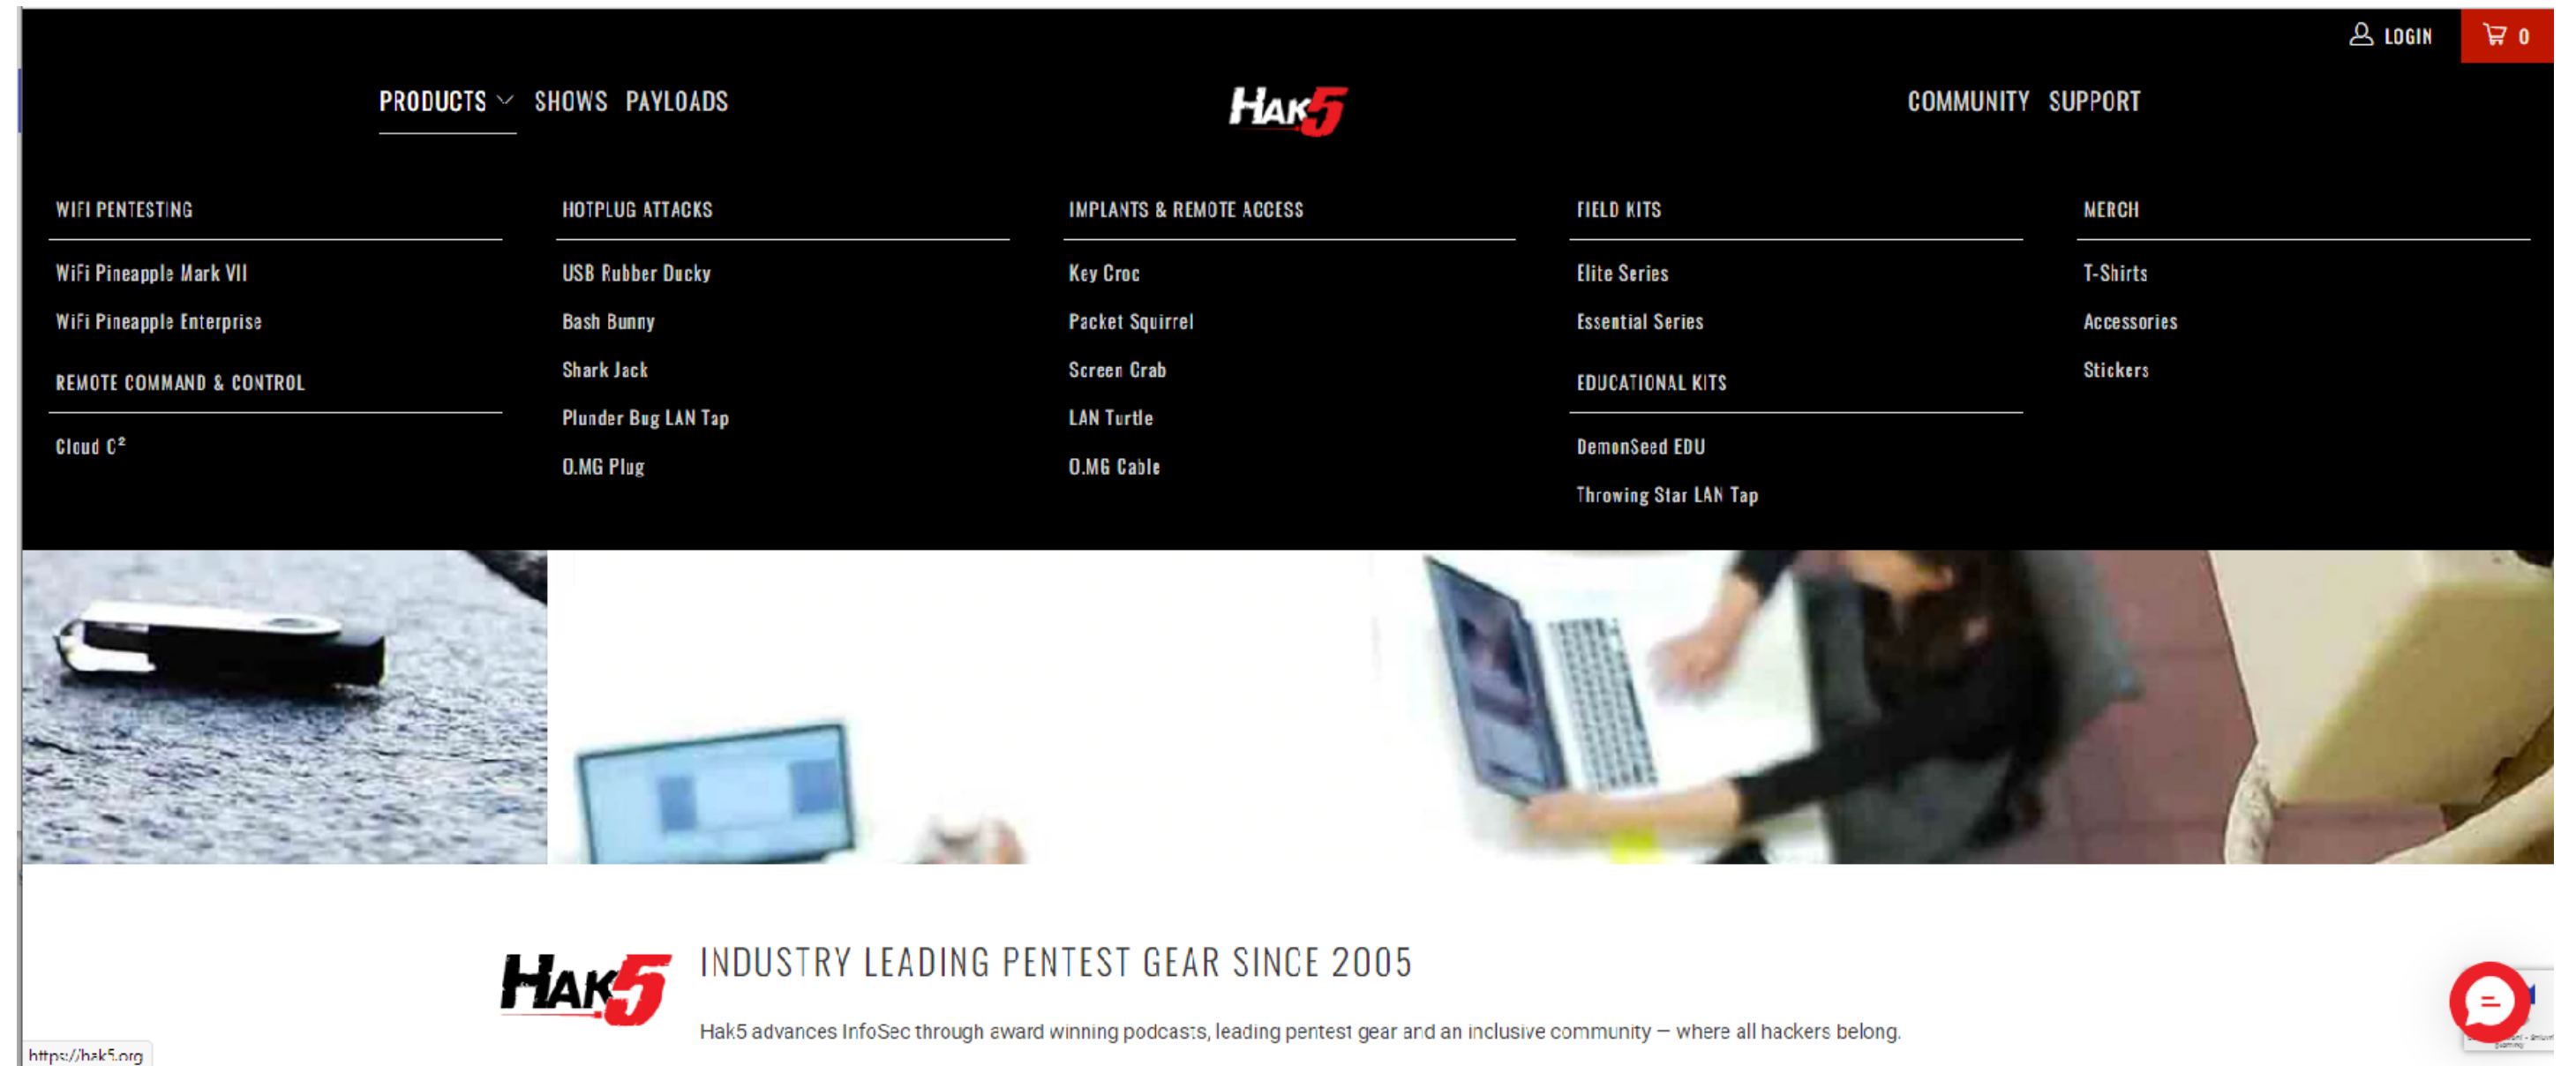

At the top right of the website, there are links for **LOGIN** and a shopping cart icon showing **0** items.

Below the navigation menu is a banner image featuring a close-up of a USB Rubber Ducky on the left, a person working on a laptop in the center, and a person's hand on a mouse on the right. Below the banner, the Hak5 logo is displayed next to the text **INDUSTRY LEADING PENTEST GEAR SINCE 2005**. Below this, a tagline reads: "Hak5 advances InfoSec through award winning podcasts, leading pentest gear and an inclusive community – where all hackers belong." In the bottom right corner, there is a red circular icon with a white speech bubble and the text "Smart - Smart Learning".

Debriefing Analysis Report Viewpoint

1. Plausibility of the suggested scenarios
2. Technology limits
3. Detection
4. Countermeasures

Display Data

Preview: Screen Crab

Screen grabber for HDMI, based on Lontium chipset for signal bridging and conversion

Captures either single frames or video, results stored locally on SD card and possibly also at C2 cloud

Remote management via C2 cloud

Debriefing Analys

1. Plausible with small operational issues
2. HDMI signal is generally unprotected, certain limits are imposed by available chipsets
3. Can be detected as LONTIUM adapter
4. Consider encrypted video links for highly sensitive areas. Regular physical inspection of highly exposed links. *Sealed ports?*

Connector Stacking - USB 3.0/3.1 Example

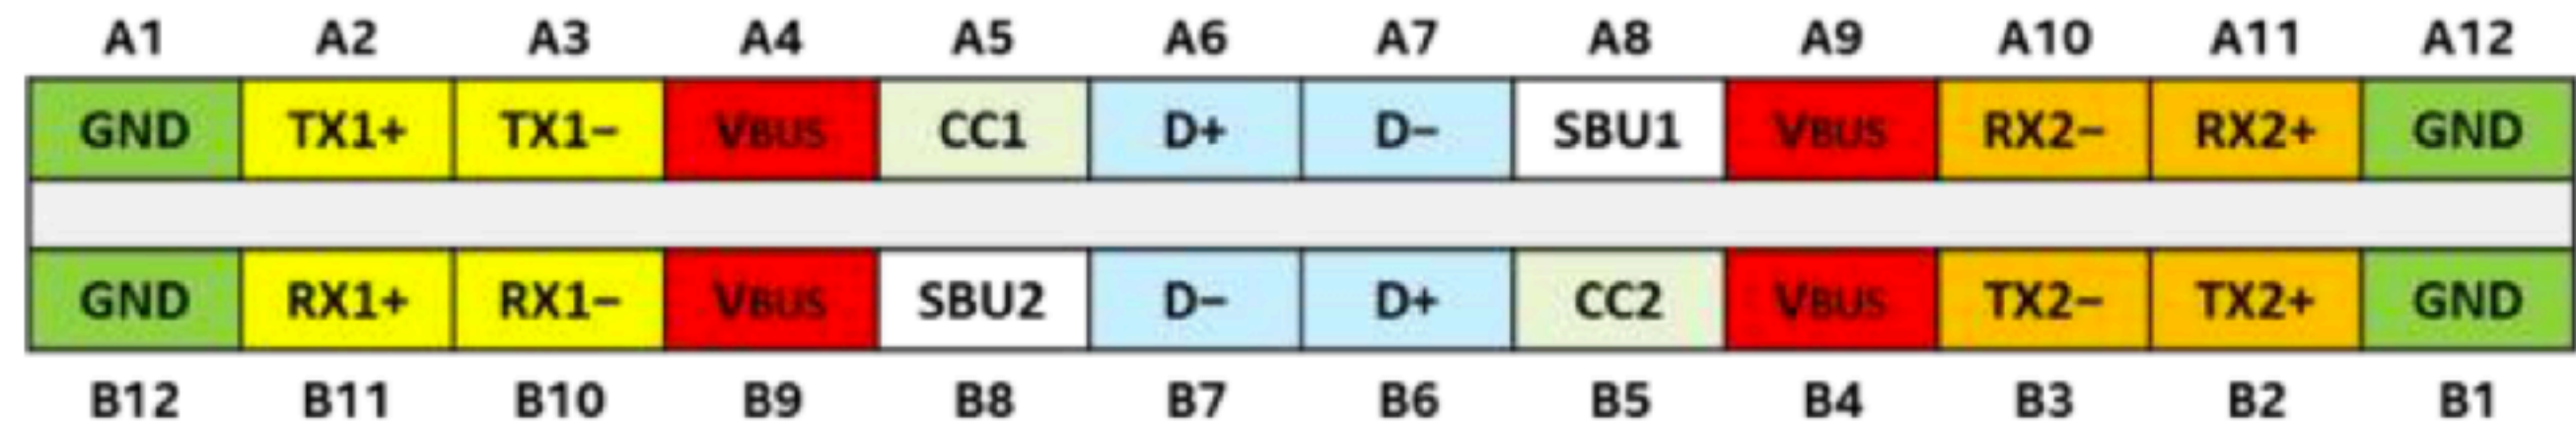

USB Type-C® – Functional Model

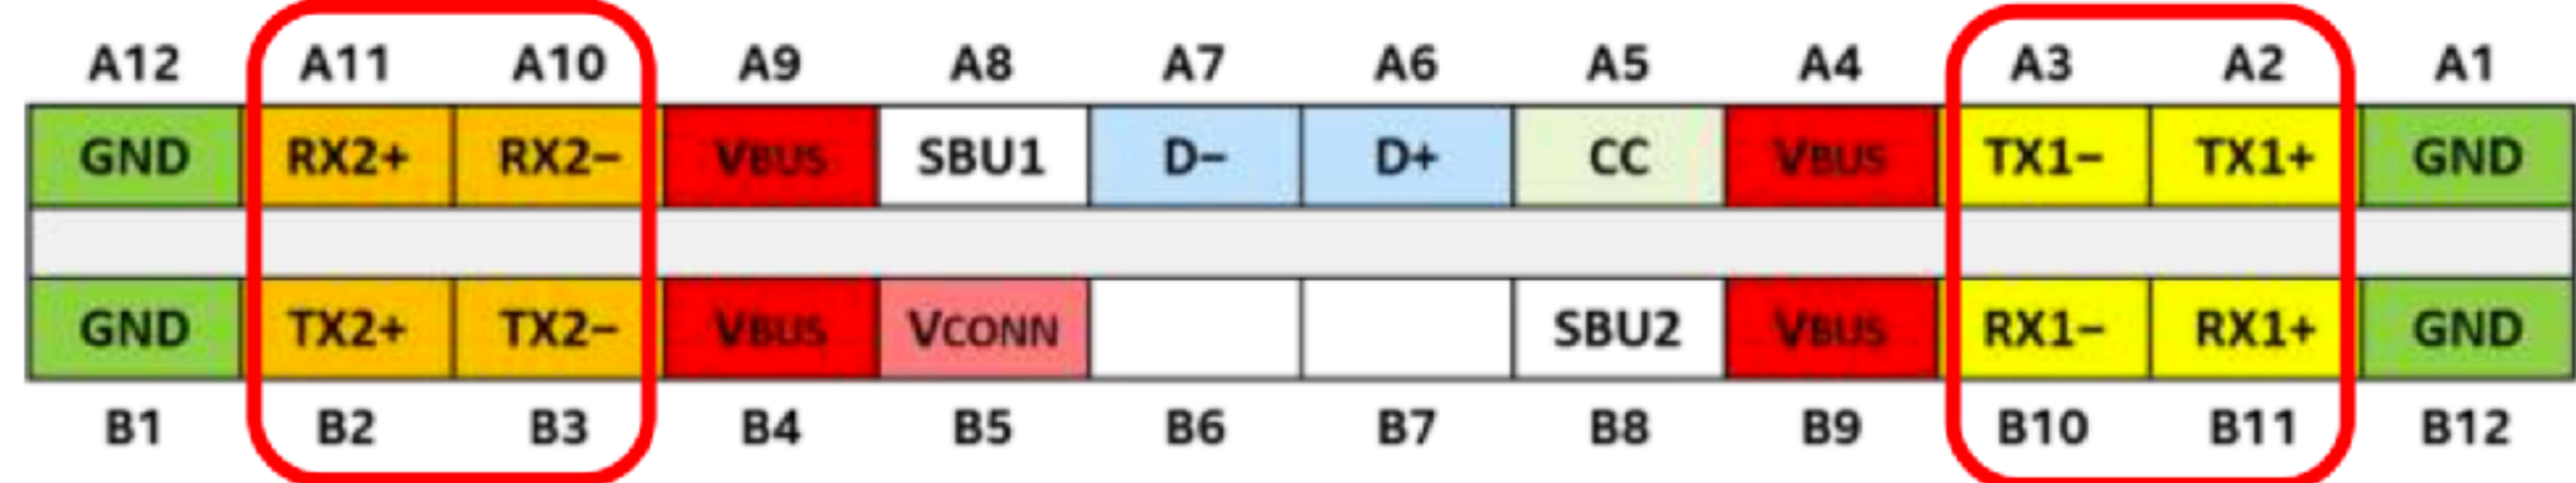

- USB 3.2 / *USB4™* data bus
 - Two sets of TX/RX pin pairs, supports x1 and x2 operation
- USB 2.0 data bus
 - Two pin sets on host, one set on device – strapped together within the host and device
- Two power buses
 - VBUS and VCONN
- Two sideband pins (SBU1/SBU2)
 - *SBTX / SBRX for USB4*
- CC – Configuration Channel
 - Two CC pins in connector
 - One CC wire in cable

O.MG Cables

“The O.MG Cable is a hand made USB cable with an advanced implant hidden inside. It is designed to allow your Red Team to emulate attack scenarios of sophisticated adversaries...”

USB HID sniffing and data injection

Remote control through embedded WiFi

Low-Speed device with certain Full-Speed sniffing capability, HID typing of 125 characters per second

Debriefing Analys

1. Plausible, both attended and unattended scenarios
2. Low-speed bus profile is quite slow for today, however, HID is a rich terrain for exploitations; especially for a combined sniffer/injector
3. Detectable heuristically; there is an original forensic detector available (discerns active vs. passive cables); can stay totally quiet and show up for very a precise amount of time
4. Besides detection, there is no robust prevention on the USB data layer, needs to be solved by a system security policy that will limit HID devices impact fundamentally

O.MG Cable Detector

"...The Malicious Cable Detector by O.MG allows you to detect malicious cables and also block data while charging. ... plug just the cable into the detector, then the detector into your computer's USB port. LED activity indicates signs of life!"

Designed to discern active vs. passive cables based on power analysis on USB 2.0 power supply lines

Uses allowlists not to alarm on original active cables by Apple, etc.

Debriefing Analys

1. Plausible, worked well with several different cables and devices
2. Its focus on power analysis is both the main strength and weakness; it can detect chips in dormant mode that would be unseen through data lines; on the other hand, it is just for cables - it cannot go deeper to e.g. distinguish malicious vs. original keyboard or mouse
3. Challenging to do similar thing for USB-C, power management/noise injections hardens this task, and yet there are those allowlists
4. From the malicious device designer viewpoint: move to USB-C, try to use a clever power management, or try to mimic those predefined original accessories templates to suppress alarms

Bash Bunny

“By emulating combinations of trusted USB devices — like gigabit Ethernet, serial, ... and keyboards — the Bash Bunny tricks computers into divulging data, exfiltrating documents, installing backdoors and many more exploits.”

Payloads and exfiltration results stored locally on SD card

Remote connection possible via network tethering

High-Speed quad-core multi device, HID typing 570 chars/second

Debriefing Analys

1. Plausible, both attended and unattended scenarios
2. USB 2.0 is old, but its exploitations are new and still evolving; big potential due to the **multiple profiles coherently acting together**
3. Detectable heuristically on a device layer due to its somewhat exotic nature; O.MG cable detector does not apply - it can only tell this is an active device, but this is obvious; can stay totally quiet and show up for a very precise amount of time
4. Besides (theoretical) detection, there is no robust prevention on the USB device layer, needs to be coped with at upper levels - USB function layer and higher

USB D+ and D-, vertical scale 101 V/div

Contactless Micro-EMP Variant (NFCKill)

NFCKill Near-Field Magnetic Pulse (35 mm axial distance)

- Roughly 30-times higher peak value than for a regular NFC terminal (ACR122) in the same setup
- Will further raise sharply when approaching a closer distance
- Static discharge-like sensing observed at < 1 cm distance, their cause and effect remains unknown

- Probably, there is a high-voltage generator discharged instantly into a primary coil, producing typical high-energy transients

Electromagnetic Environments

- **HPEM** ~ High-Power Electromagnetic, general attribute defined in IEC 61000
- **HEMP** ~ High-altitude EM Pulse, i.e. a nuclear variant of the general HPEM attack
- **EMP** ~ EM Pulse, popular term mainly for HEMP, **NNEMP** then denotes non-nuclear EMP
- **HPRF DE** ~ High-Power RF Directed Energy, also known as **HPM** (High-Power Microwave)
- **IEMI** ~ Intentional EM Interference, an academic term, also covers jamming

In 2017, EMP (as Nuclear-sourced HPEM) “Exploded” in Newsrooms

[<https://www.youtube.com/watch?v=fpQ8tj0aVRc>]

Figure 2-2. General basis of the E1 HEMP generation process. Gammas from the nuclear burst interact with the upper atmosphere – generating Compton electrons, which are turned in the Earth’s geomagnetic field, and produce a transverse current that radiates an EM pulse towards the Earth.

Response of Long Lines to Nuclear High-Altitude Electromagnetic Pulse (HEMP)

Vasily N. Gretsai, Andrey H. Kozlovsky, Vadim M. Kuvshinnikov, Vladimir M. Loborev, Yuri V. Parfenov, Oleg A. Tarasov, and Leonid N. Zdoukhov

Abstract— During high-altitude nuclear testing in 1962 over Kazakhstan, several system effects were noted due to the high-altitude electromagnetic pulse (HEMP). In particular a 500-km-long aerial communications line experienced a failure due to the damage of its protective devices. In this paper, this failure is examined in detail beginning with the calculation of the incident HEMP environments, including those from the early- and late-time portions of the HEMP. In addition, the currents and voltages induced on the line are computed and the measured electrical characteristics of the protection devices are presented. With this information it is possible to determine which portions of the HEMP environment were responsible for particular protection failures. The paper concludes with recommendations for further work required to understand the best ways to protect power lines from HEMP in the future.

early-time HEMP. MHD EMP forms due to the interaction between the disturbed region of the burst and the geomagnetic field. The electrical current systems arising during the motion of the ionized medium lead to an entire or partial pushing of the geomagnetic field out of the boundaries of the burst-perturbed region. The range of this geomagnetic effect and, hence, the intensity of the MHD EMP generation are defined by the extent of the gas-dynamic and ionized perturbation of the atmosphere following the nuclear burst.

In this paper, an example case of an aerial communication line is provided to consider the currents and voltages induced due to the different HEMP components for the specific physical experiment. In addition, the contribution of each HEMP

Vasily N. Gretsai was born in Melitopol, Ukraine, on July 29, 1961. He received the Dipl. of nuclear physics from Kharkov State University, Kharkov, Ukraine, in 1984 and the Ph.D. degree from the Central Institute of Physics and Technology (CIPT), Serfiev Posad, Russia, in 1995. In 1987, he joined the CIPT where he conducts research in pulsed electromagnetic fields.

Andrey H. Kozlovsky was born in Volgograd, Russia, on May 11, 1960. He received the Dipl. of Engineer in aerodynamics and thermodynamics from Moscow Institute of Physics and Technology, Moscow, Russia, in 1982 and Ph.D. degree from the Central Institute of Physics and Technology (CIPT), Serfiev Posad, Russia, in 1992. In 1983, he joined the CIPT where he is currently engaged in research on man-made electromagnetic pulses.

Vadim M. Kuvshinnikov was born on April 11, 1943, in Ufa, Russia. He received the Dipl. of Engineer-Physicist from the Moscow Physical Engineering Institute, Russia, in 1966, and the Ph.D. degree from the Central Institute of Physics and Technology (CIPT), Serfiev Posad, Russia, in 1987. From 1969 to 1972, he was a Postgraduate and worked on improving his skills in theoretical physics. In 1987 he became a Professor at CIPT, where he is currently a Leading Scientist. He is the author of more than 200 scientific papers devoted to quantitative descriptions of antenna-medium interaction processes, investigations of the physics of the EMP evolution from surface and magnetospheric nuclear explosions, and mathematical simulations of EMP effects on various objects.

Vladimir M. Loborev was born on November 23, 1937, in Novosibirsk, Russia. He received the Dipl. of Engineer-Chemist from the High Military Naval College, St. Petersburg, Russia, in 1960, and the Ph.D. degree from the Central Institute of Physics and Technology (CIPT), Serfiev Posad, Russia, in 1977. He has worked at CIPT since 1962 and in 1983 he became a Professor there. Currently, he is the Director of CIPT. He is the author of more than 400 scientific papers devoted to investigations of the physics processes of nuclear weapon effects simulation, theoretical and experimental investigations of nuclear weapons effects parameters including EMP and the physics base of these effects, and substantiation of the development and application of the experimental base of simulation facilities to investigate nuclear weapon effects. Dr. Loborev is a member of the Russian Academy of Natural Sciences and the International Academy of Information.

Oleg A. Tarasov was born in Keerjach, Russia, on April 12, 1964. He received the Dipl. of Engineer-Physicist from the Moscow Physical Engineering Institute, Russia, in 1987, and the Ph.D. degree from the Central Institute of Physics and Technology (CIPT), Serfiev Posad, Russia, in 1993. In 1987, he joined CIPT. His research interests include the effects caused by natural and man-made electromagnetic pulses on antenna-feeder facilities and communication and power systems.

Leonid N. Zdoukhov was born on January 15, 1949, in Tallinn, Estonia. He received Dipl. of radiophysics from the Leningrad State University, St. Petersburg, Russia, in 1972, and the Ph.D. degree from the Central Institute of Physics and Technology (CIPT), Serfiev Posad, Russia, in 1982. Since 1975 he has worked at CIPT of the Russian Federation Ministry of Defense, became a Professor there in 1986, and is currently a Department Head. He is the author of more than 100 scientific papers devoted to EMP coupling to aerial and underground cables, source region electromagnetic pulse (SREMP) coupling to antennas and flying vehicles, EMP simulators and applications thereof for testing system response to nuclear burst EMP effects, and computers and experimental methods to evaluate joint EMP and ionizing radiation effects on radioelectronic equipment. His interests include the problems of reproducing EMP effects and system testing.

Yuri V. Parfenov was born on February 16, 1947, in Dmitriev, Russia. He received the Dipl. of Engineer-Physicist from the Moscow Physical Engineering Institute, Moscow, Russia, in 1971, the Ph.D. degree from the Central Institute of Physics and Technology (CIPT), Serfiev Posad, Russia, in 1980. He has worked at CIPT since 1975. He became a Professor there in 1982. He is now the Deputy Director of CIPT. He is the author of more than 200 scientific papers on calculation methods to investigate EMP effects on cables and structures to reproduce these effects, calculation methods of SREMP and experimental methods to study SREMP effects, simulators for reproducing combined effects of SREMP and ionizing radiation, and applications of EMP simulations for remedial (corrective) purposes.
