START WITH SOMETHING FAMILIAR

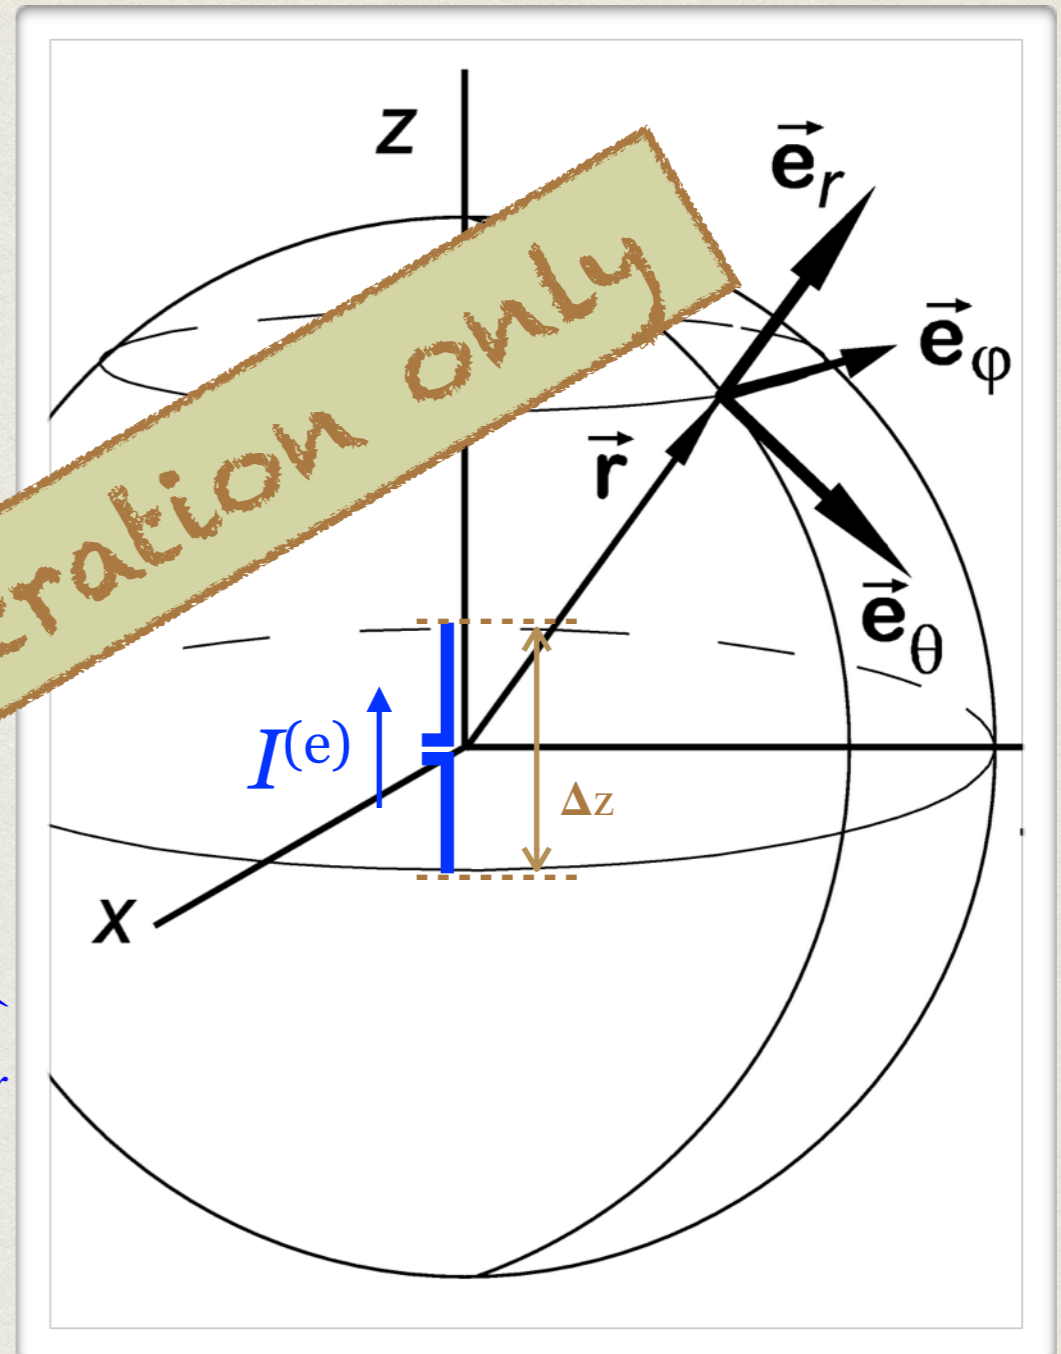

[Buddipole QRV by 5B8AP]

THE IDEAL ELECTRIC DIPOLE

- Electrically small, i.e. $\Delta z \ll \lambda$, uniform amplitude current element.
- Ordinary dipole is covered by integration over these elements.
- In the far field, a donut-like pattern bearing the vertical polarisation is produced.
- In general, its field has the following components.

$$\vec{E}_{edp}(I^{(e)}) = E_{edp,\theta}(I^{(e)}) \cdot \hat{e}_\theta + E_{edp,r}(I^{(e)}) \cdot \hat{e}_r$$

$$\vec{H}_{edp}(I^{(e)}) = H_{edp,\phi}(I^{(e)}) \cdot \hat{e}_\phi$$

(illustration purpose only)

THE IDEAL ELECTRIC DIPOLE

- Electrically small, i.e. $\Delta z \ll \lambda$, uniform amplitude current element.
 - Ordinary dipole is covered by integration over these elements.
- In the far field, a donut-like pattern bearing the vertical polarisation is produced.
- In general, its field has the following components.

$$\vec{E}_{edp}(I^{(e)}) = E_{edp,\theta}(I^{(e)}) \cdot \hat{e}_\theta + E_{edp,r}(I^{(e)}) \cdot \hat{e}_r$$

$$\vec{H}_{edp}(I^{(e)}) = H_{edp,\phi}(I^{(e)}) \cdot \hat{e}_\phi$$

(illustration purpose only)

LONG STORY SHORT

$$\vec{H}_{edp}(I^{(e)}) = \frac{I^{(e)} \Delta z}{4\pi} j\beta \left(\frac{1}{r} + \frac{1}{j\beta r^2} \right) e^{-j\beta r} \sin\theta \cdot \hat{e}_\phi$$

$$\vec{E}_{epd}(I^{(e)}) = \frac{I^{(e)} \Delta z}{4\pi} j\omega\mu \left(\frac{1}{r} + \frac{1}{j\beta r^2} \right) e^{-j\beta r} \sin\theta \cdot \hat{e}_\theta$$
$$+ \frac{I^{(e)} \Delta z}{2\pi} \left(\frac{1}{r^2} - \frac{1}{\beta^2 r^3} \right) e^{-j\beta r} \cos\theta \cdot \hat{e}_r$$

$$- \frac{I^{(e)} \Delta z}{4\pi} j\omega\mu \left(\frac{1}{r} + \frac{1}{j\beta r^2} - \frac{1}{\beta^2 r^3} \right) e^{-j\beta r} \sin\theta \cdot \hat{e}_\theta$$

$$+ \frac{I^{(e)} \Delta z}{2\pi} \eta \left(\frac{1}{r^2} - j \frac{1}{\beta r^3} \right) e^{-j\beta r} \cos\theta \cdot \hat{e}_r$$

keep calm, illustration only

LONG STORY SHORT

$$\vec{H}_{edp}(I^{(e)}) = \frac{I^{(e)} \Delta z}{4\pi} j\beta \left(\frac{1}{r} + \frac{1}{j\beta r^2} \right) e^{-j\beta r} \sin \theta \cdot \hat{e}_\phi$$

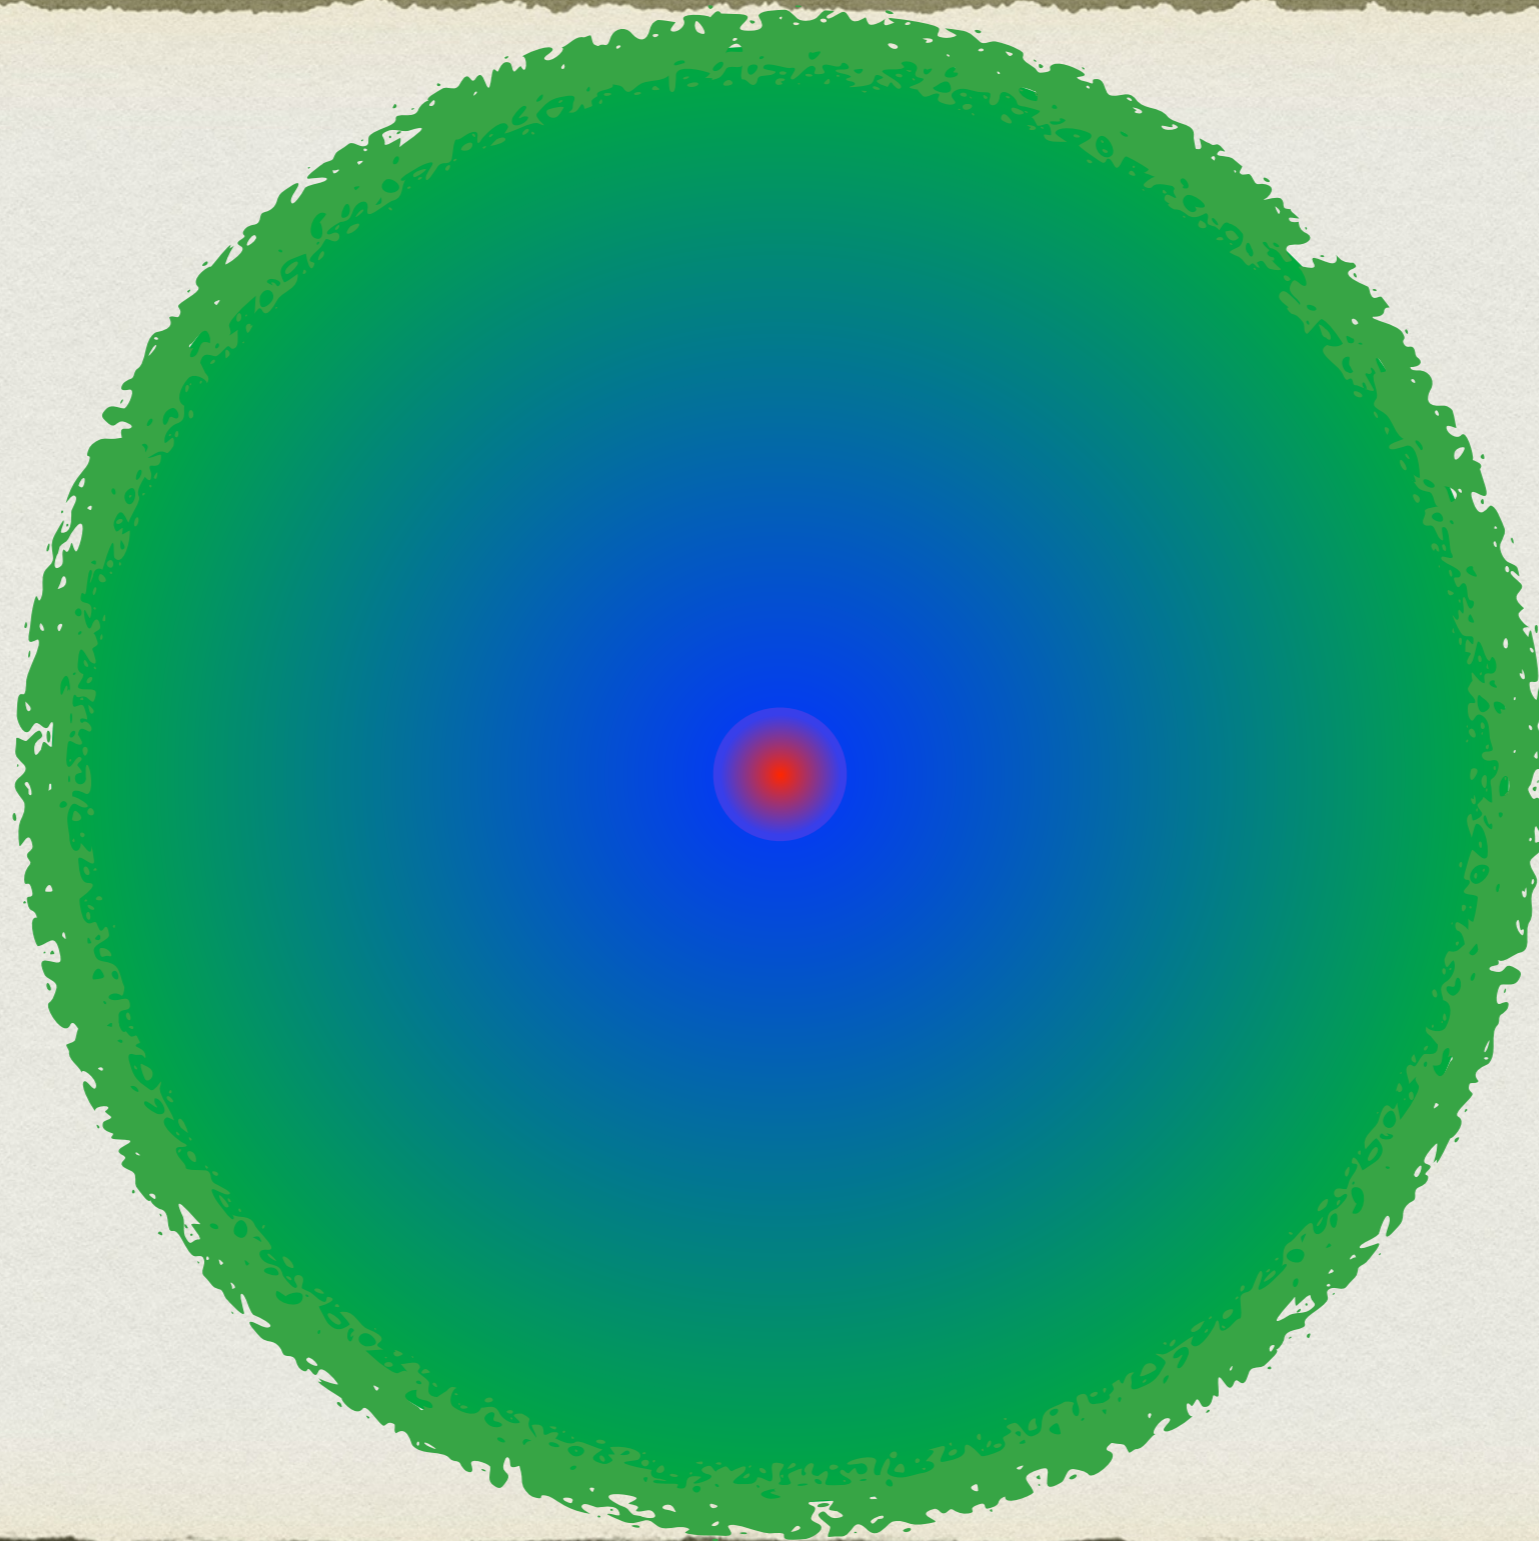

$$\begin{aligned} \vec{E}_{epd}(I^{(e)}) &= \frac{I^{(e)} \Delta z}{4\pi} j\omega\mu \left(\frac{1}{r} + \frac{1}{j\beta r^2} - \frac{1}{\beta^2 r^3} \right) e^{-j\beta r} \sin \theta \cdot \hat{e}_\theta \\ &\quad + \frac{I^{(e)} \Delta z}{2\pi} j\omega\mu \left(\frac{1}{j\beta r^2} - \frac{1}{\beta^2 r^3} \right) e^{-j\beta r} \cos \theta \cdot \hat{e}_r \end{aligned}$$

$$\begin{aligned} &= \frac{I^{(e)} \Delta z}{4\pi} j\omega\mu \left(\frac{1}{r} + \frac{1}{j\beta r^2} - \frac{1}{\beta^2 r^3} \right) e^{-j\beta r} \sin \theta \cdot \hat{e}_\theta \\ &\quad + \frac{I^{(e)} \Delta z}{2\pi} \eta \left(\frac{1}{r^2} - j \frac{1}{\beta r^3} \right) e^{-j\beta r} \cos \theta \cdot \hat{e}_r \end{aligned}$$

NEAR, FAR

- Basing on the dominating E , H field terms, it is useful to distinguish:
 - *Reactive near field (XNF)*, where the terms with $1/r^2$ and $1/r^3$ dominate. Energy is mainly stored and exchanged between E and H .
 - *Radiating near field (Fresnel region)*, where the $1/r^2$ terms start to dominate, i.e. $r > \lambda/2\pi$. Energy is mainly radiated with unstable patterns, however.
 - *Far field (Fraunhofer region)*, where the $1/r$ terms remain to dominate and the plane wave model can be used. Several conditions shall be met: $r > 2D^2/\lambda$, $r > 5D$, $r > 1.6\lambda$, where D is the largest antenna dimension. Energy is radiated with a distance-independent field pattern.

WHEREVER YOU ARE

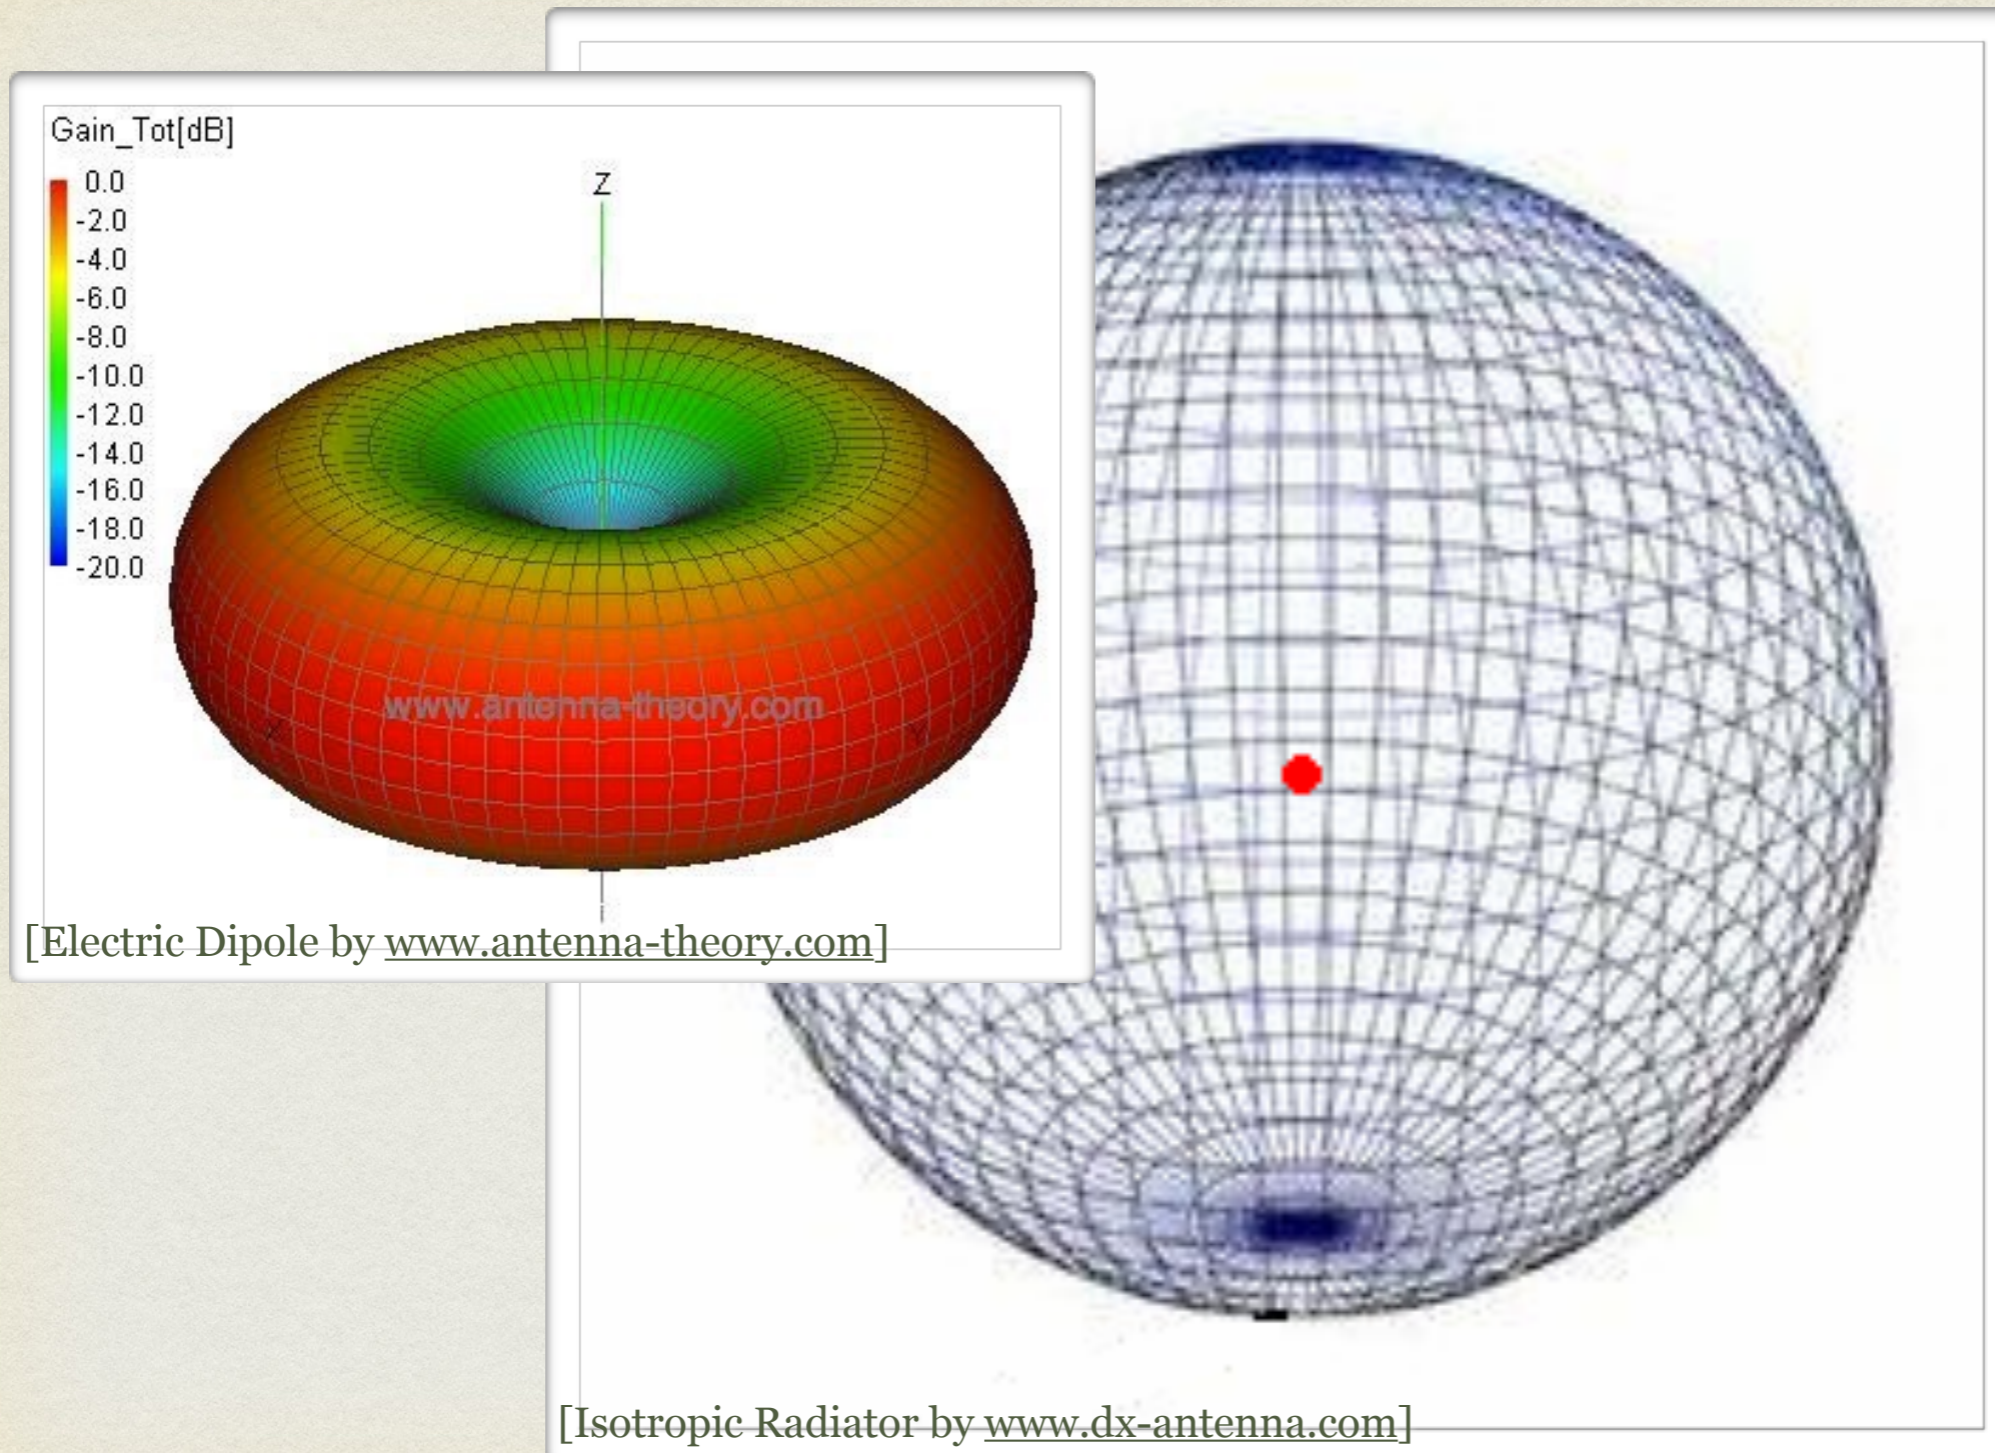

UNDERSTANDING DIRECTIVITY AND GAIN

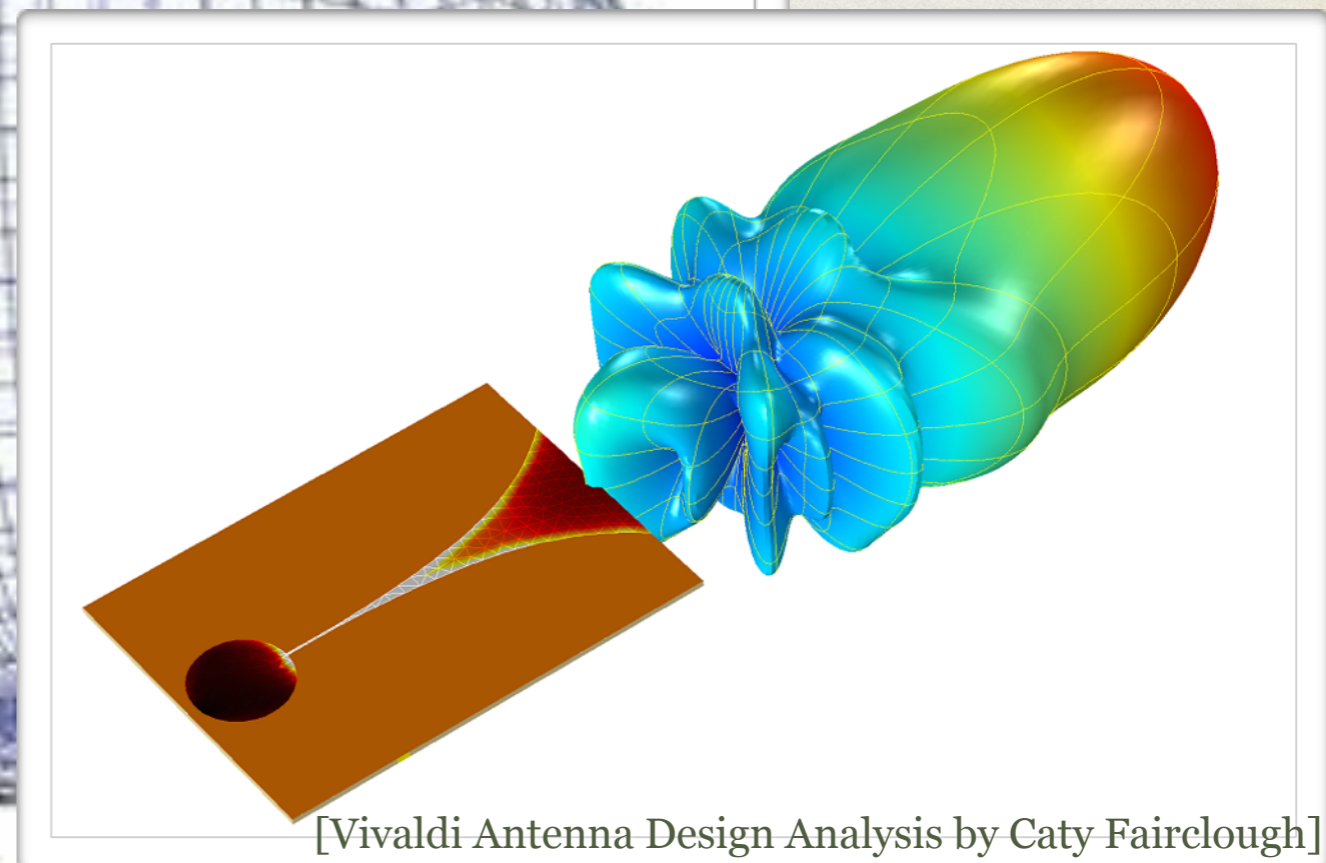

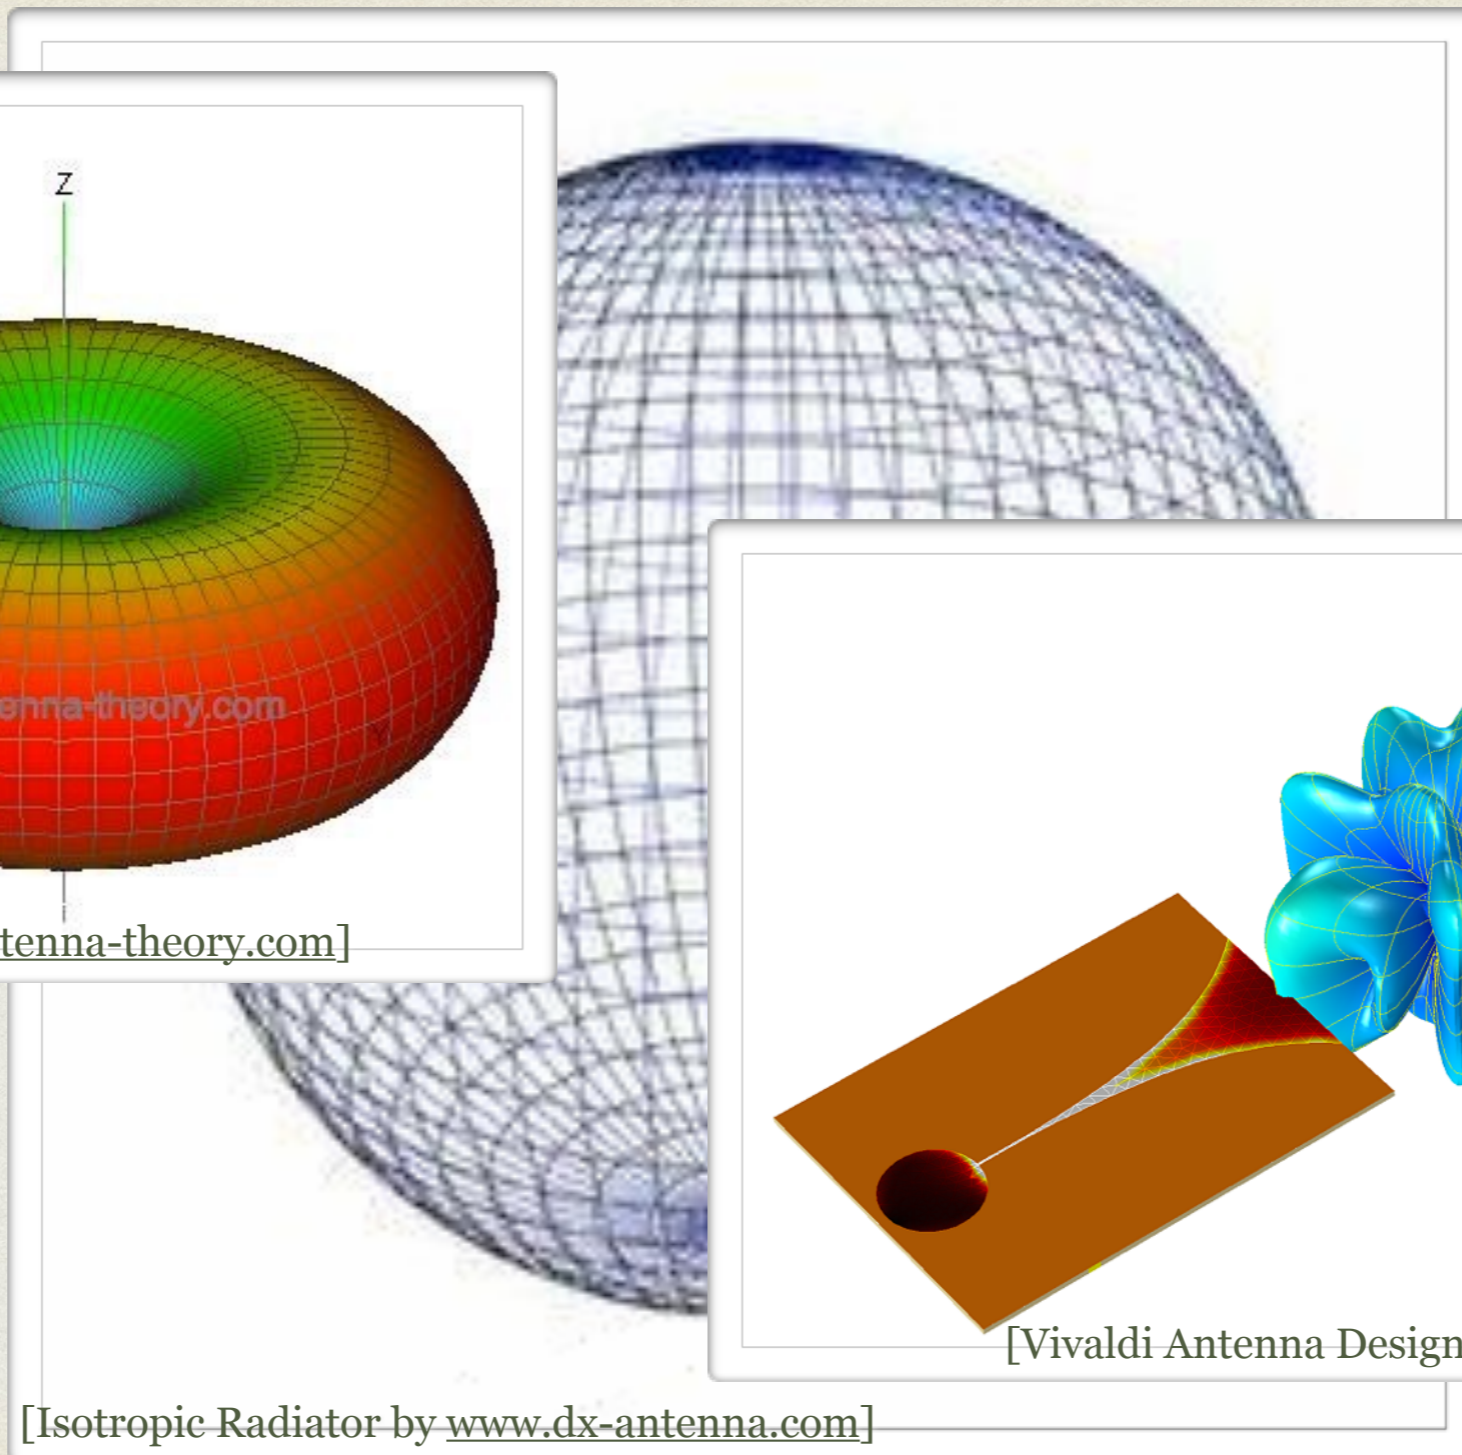

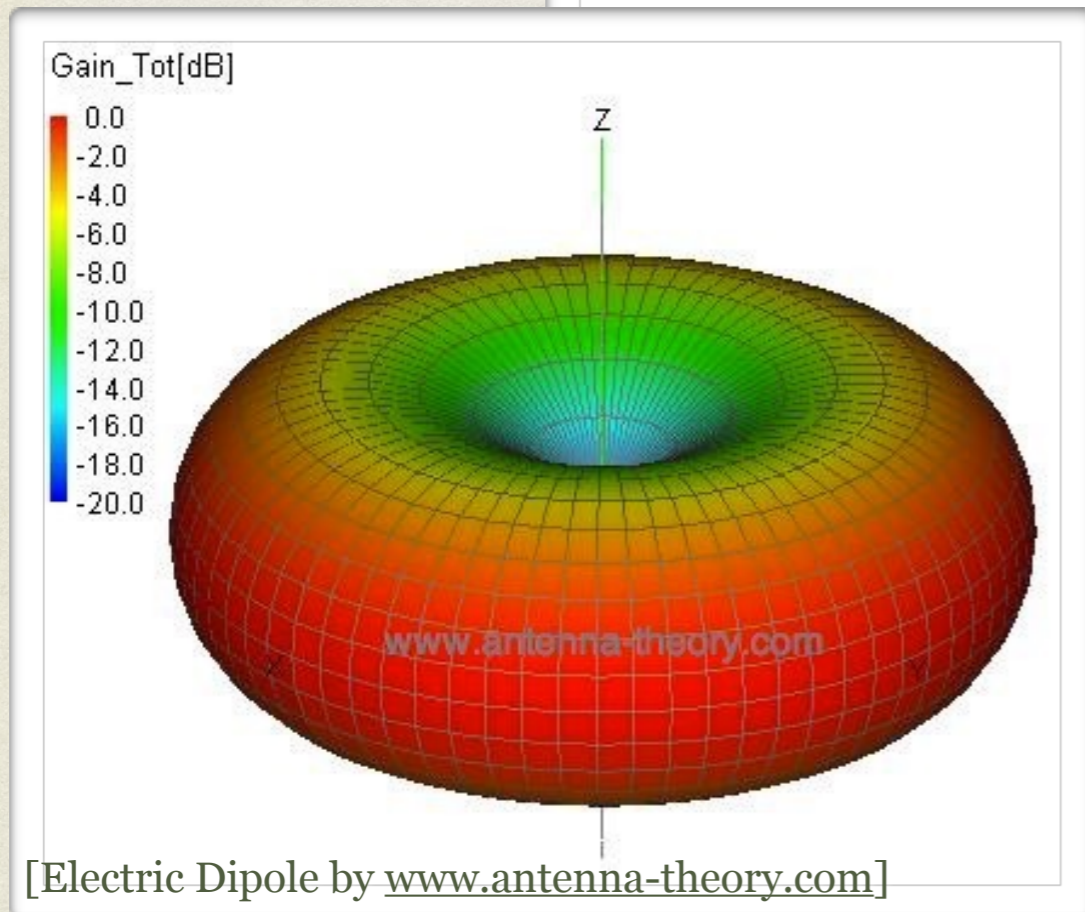

[Isotropic Radiator by www.dx-antenna.com]

UNDERSTANDING DIRECTIVITY AND GAIN

UNDERSTANDING DIRECTIVITY AND GAIN

BLUETOOTH VS. NFC

- radiating Far Field vs. inductive Near Field
- comfort vs. energy feed
- smart devices vs. smart cards

NFC IS NOT

- ...magically immune to radio attacks
- Passive sniffing confirmed to dekametres distance
- So, for NFC, a proper cryptographic protection of data being exchanged is also very important
 - in this viewpoint, Bluetooth LE has a better starting position, since the link encryption is a natural part of the standard

NFC TOGETHER WITH BLE

- Rather than competitors, we can assume these technologies will work hand-in-hand together in future applications
 - NFC-based “tap” can signalise user’s will to communicate while BLE would take care about the rest of data exchange enjoying the comfort of NFC

BLE ESSENTIALS

ALL THOSE BLUE TEETH

- Bluetooth **Basic Rate** (1 Mbps)

–core spec. 1.x, 1999-2003

- Bluetooth **Enhanced Data Rate** (2 or 3 Mbps)

–core spec. 2.x, 2004-2007

–taken together, BT BR/EDR is more or less a “serial link over the radio”

- Bluetooth **High Speed** (54 Mbps with 802.11)

–also called AMP ~ *Alternate MAC/PHY*

–core spec. 3.x, 2009

- Bluetooth **Low Energy**, a.k.a. Bluetooth Smart (1 Mbps, bulk-mode only)

–core spec. 4.x, 2010-2014

Bluetooth Classic

Bluetooth Smart

BLE SPECTRUM ALLOCATION

- BLE works in the 2.4 GHz ISM band
- Defines 40 RF channels of 2 MHz bandwidth as:

$$f_k = 2042 + 2k \text{ MHz, where } k = 0..39$$

- channels no. 0, 12, and 39 (RF numbering!) are reserved for the *advertisement* protocol
- GFSK modulation with TX power range -20 dBm to 10 dBm, RX sensitivity \leq -70 dBm
- radio links defined by: frequency hopping sequence, access address, and connection intervals
- short range communication design with no special adaptive coding and modulation (it's understood...)

BLE RANGE LIMITS

Module	Typical TXP	Sensitivity	Direction	Antenna Attenuation	Link Budget	Calculated Range	Tested Range
BLE121LR	8 dBm	-98 dBm	Front	-3 dB	100 dB 	470m 	450m
BLE121LR	8 dBm	-98 dBm	Back	-7 dB	92 dB 	300m 	300m
BLE121LR	8 dBm	-98 dBm	Side	-5 dB	96 dB 	370m 	340m

Figure 12: Range of BLE121LR vs BLE121LR when antennas are 1.5m above GND

GROUND PLANE EFFECTS

FRIIS TRANSMISSION EQ.

- Let dBm denote decibels over 1 mW power and let dBi denote decibels of the antenna power gain over the isotropic source.
 - ▶ $[P]_{\text{dBm}} = 10 \log (P/10^{-3}) = 10 \log P + 30$
 - ▶ $[G]_{\text{dBi}} = 10 \log (G/1) = 10 \log G$
- The available receiver antenna terminal power is then:

$$[P_r]_{\text{dBm}} = [P_t]_{\text{dBm}} + [G_t]_{\text{dBi}} + [G_r]_{\text{dBi}} - 20 \log \frac{4\pi}{\lambda} - 10n \log d$$

$n = 2$ for the free space loss

RSSI MODEL

- Let RSSI denote the value provided by the Read RSSI Command via BLE HCI.
- Inspired by the Friis transmission eq., we can write:

$$RSSI(d) = RSSI(d_0) - 10n \log \frac{d}{d_0} + X$$

- ▶ d_0 denotes the calibration distance
- ▶ n is a model parametrisation constant ($n = 2$ in the free space), referred to as the *attenuation factor*
- ▶ X is a random variable covering fluctuations

RSSI MODEL

- Let RSSI denote the value provided by the Read RSSI Command via BLE HCI.
- Inspired by the Friis transmission equation, we write:

$$RSSI(d) = P_{TX} - 10n \log \frac{d}{d_0} + X$$

- ▶ d_0 denotes the reference distance
- ▶ n is the path loss exponent constant ($n = 2$ in the free space), referred to as the path loss factor
- ▶ X is a random variable covering fluctuations

CC-2540-based BLE sniffer

BLE SECURITY GOALS - WHAT IS ACHIEVED

- Private address generation and data link encryption cryptographic schemes are quite robust and sufficient
- They do, however, both rely on the authentication and key agreement step - i.e. so called *pairing*
 - unfortunately, this procedure is still flawed, even after the introduction of the *Secure Connections* protocol in BT Core Spec. v 4.2

BLE LEGACY PAIRING

- Vulnerable to passive eavesdropping
 - basically the same problem as with BT BR/EDR PIN-based link key generation
- Vulnerable to active impersonation
 - works even for a one-time PIN
- Vulnerable to MITM
 - different cryptographic flaw, but at the end, it is again a similar situation to that of the PIN-based link key generation in BT BR/EDR

BLE LEGACY PAIRING

- Vulnerable to passive eavesdropping

- basically the same problem as with BT BR/EDR link key generation

- Vulnerable to active impersonation

- works even for a one-time password

- Vulnerable to MITM

- different graphic flaw, but at the end, it is again a similar situation that of the PIN-based link key generation in BT BR/EDR

excellent for pairing in a well shielded secret chamber

BLE SECURE CONNECTIONS

- Designed as an enhancement of the *Legacy Pairing*
 - in the very same way as *Secure Simple Pairing* for BT BR/EDR replaced the insufficient PIN-based link key generation and authentication
- Cryptographically speaking, it fails to protect namely:
 - against the passive eavesdropping of the authentication PIN
 - against the active MITM based on device capabilities spoofing

(in the very same way as *Secure Simple Pairing* does NOT do for BT BR/EDR...)
- Anyway, we can still revert to the *Out Of Band* mode of *Legacy Pairing* to provide our own authenticated key agreement protocol
 - similarly, we can (shall) explicitly insist on the device capabilities that were reported/used

BLE SECURE PING PROCEDURE

- Offers a standard, reliable check of whether a particular device is still in the radio range of the peer device (e.g. of a mobile phone or a computer)
- Based on ACL packet with cryptographically protected integrity
 - works together with LE Authenticated Payload Timeout
- Assumes proper checking of *packetCounter* in CCM nonce

RF SPECTRUM WRAP-UP

advertising

connection

[Indicative wide-band RF scans by RigExpert IT-24 analyser for 2.4 GHz]

CONCLUSIONS

- Bluetooth Low Energy is a new, completely redesigned radio interface in the Bluetooth family
 - for instance, the connection establishment can be a breeze, now, thanks to the *advertisement* procedure
- Excellent choice for a telemetry, in particular with mobile applications
 - assumes ad hoc “tweets” rather than intensive persistent communication
 - audio-video applications shall rather stay with BT BR/EDR
- Ideal interface for small size, personal security modules
- Can work for years with a standard button-cell battery

CAVEATS

- We shall be aware of known weaknesses, especially in the pairing procedure
 - we shall possibly devise an extra protection based on our risk analysis outputs
- Furthermore, the BLE services deserve a penetration test that would also focus on the host OS and application integrity
 - fuzz-testing would be highly welcome here to prevent a malware take-over

REALLY, DO THE PENTEST!
